Maxelerator GTM Studio

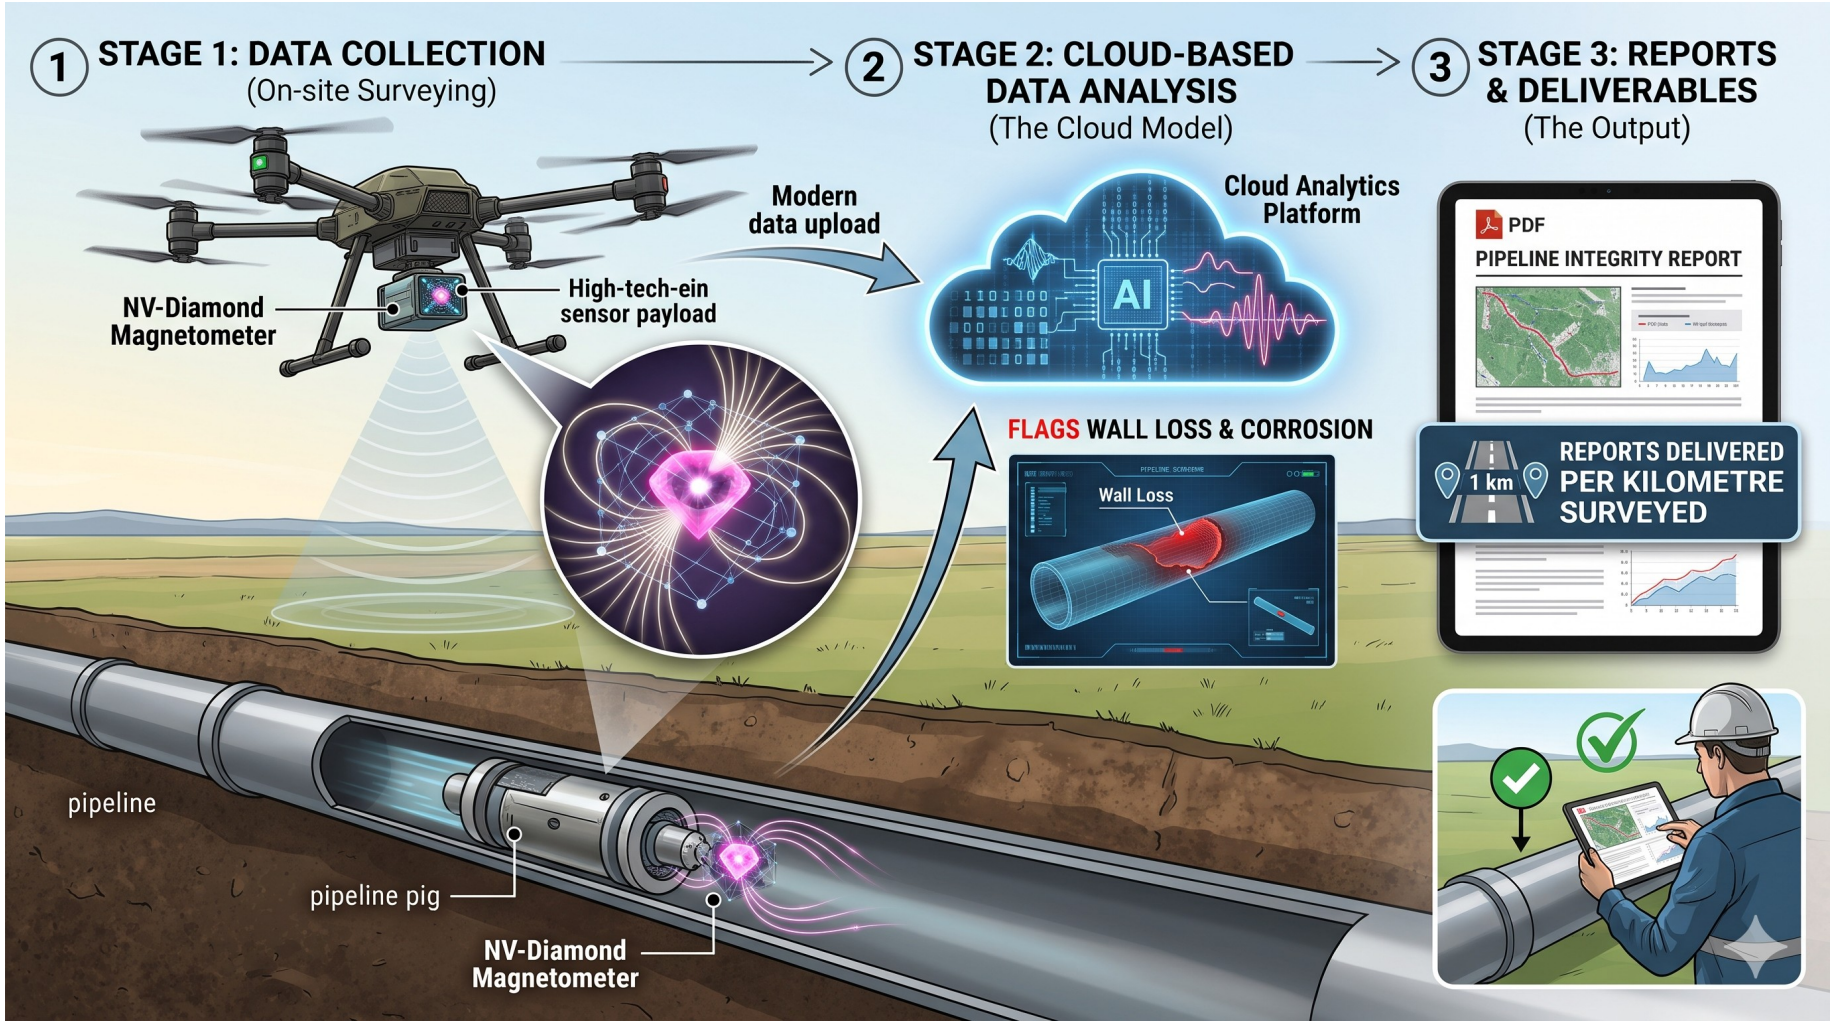

An AI go-to-market team for every deeptech startup in the cohort, coordinated on BAND, priced by a local model, billed with FlexPrice

BAND
agents coordinate in shared rooms

Local Qwen
assigns each startup's pricing

FlexPrice
meters and bills every step

Meet QubitSense, the startup this demo prices

Sector
Quantum sensing, seed stage

Product
NV-diamond magnetometers on drones and pipeline pigs, plus a cloud model that flags wall loss

Buyers
Pipeline integrity managers at midstream operators and water utilities

Pricing today
One paid pilot: $40k for 25 km

Deeptech founders hit three walls after the prototype

No GTM team

Technical founders need an ICP, pricing, messaging and a launch plan, and have no one to write them.

Pricing that can't follow cost

Compute and field costs vary per customer; flat subscriptions underprice heavy users or block light ones.

Slow enterprise buying

Pilots before purchase orders, technical evaluators, procurement. Months pass before revenue.

Maxelerator's answer: give every startup a GTM team on day one, and charge for it by usage.

One message in BAND produces a billed playbook

Kick off

Program manager posts one message in the cohort's BAND room

Agents work

Strategist assigns sections; 4 specialists write in parallel

Local Qwen prices

Pricing Architect calls the trained model as a tool

FlexPrice bills

Each saved section is one usage event: 95 credits a playbook

Each startup gets **an 8-section playbook**: executive summary, market and ICP, positioning, pricing with a ready FlexPrice setup, channels, sales play, 90-day plan, metrics and risks.

Six minutes of training made a 0.5B model a pricing analyst

Same Qwen2.5-0.5B on a laptop, same QubitSense profile (quantum pipeline sensing; pilot at $40k for 25 km), same validator

BEFORE: original model

Rejected: 5 errors

- Invents a billing model that doesn't exist
- Leaves the pilot fee empty despite the $40k
- Invalid meter name "Pilot"
- Prices in the wrong form
- A list where a sentence belongs

AFTER: trained adapter

Accepted: ready for FlexPrice

Pricing model	**Platform fee + usage**
Paid pilot	**$40,000 for 12 weeks**
Platform fee	**$2,000 per month**
Usage price	**$400 per unit to 100, then $320**
Meter	**device_month, SUM of quantity**

It learned the task within the first 120 training steps

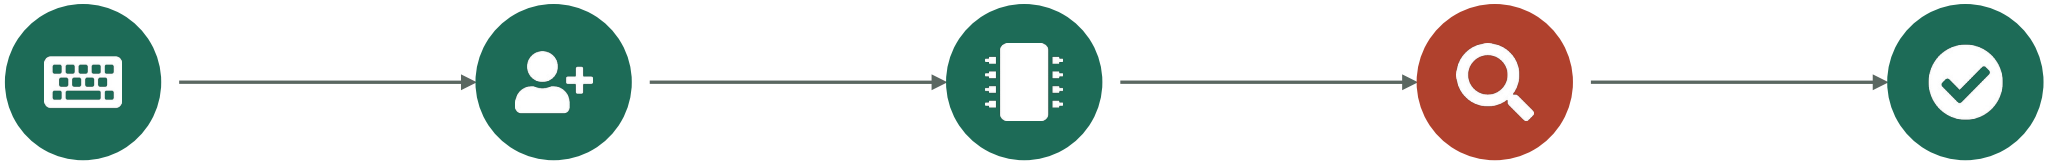

2.143 → 0.011
validation loss, start to finish

≈ 6 min
on a laptop (Apple Silicon, MLX)

0.15%
of weights trained (LoRA adapter)

Steps 180–290 were not in the shared log.

Live demo: one sentence became an approved, billable plan

Founder types one sentence

Weldbot: self-programming welding robots for job shops. Pilot unpriced; 10-week hardware lead time

Claude onboards it

Writes the profile; FlexPrice wallet opens with 500 credits

Local Qwen drafts pricing

Platform fee plus usage; $25k pilot for 12 weeks

Claude checks the draft

Rejects it and asks the founder 3 questions instead of inventing prices

Founder answers, mentor approves

Playbook built, FlexPrice plan ready (dry run), 90 credits used

QWEN'S DRAFT: REJECTED

- 12-week pilot clock starts at order, but hardware takes 10 weeks: about 2 weeks of real use
- $25k pilot price has no evidence behind it
- Success criteria say nothing about welding

AFTER THE FOUNDER'S ANSWERS: APPROVED

- Robots-as-a-service: $4,000 per robot-month, 120 arc-hours included
- $15 per arc-hour above 120
- Pilot: $15,000, 8 weeks from commissioning; success = programming under 30 min per part, rework under 2%

How to run the demo

SETUP, ONCE (MAC WITH APPLE SILICON)

1. Install the studio

```
source ~/qwen-local/.venv/bin/activate
cd maxelerator-gtm-studio && pip install -e .
```

2. Point pricing at the local model

```
cp .env.example .env
# then set MAXEL_PRICING_LLM=openai in .env
```

3. Serve the trained Qwen (own Terminal tab)

```
mlx_lm.server --model mlx-community/Qwen2.5-
  0.5B-Instruct-4bit --adapter-path <run>/adapter
  --port 8081
```

4. Start Claude in the studio folder

```
claude
```

ON STAGE (ABOUT 4 MINUTES)

5. Describe a new startup in one sentence
Ask Claude to run the full Maxelerator flow for it

6. Let it onboard and price
The local Qwen drafts; Claude checks the draft against the facts

7. Answer its questions
Business model, usage unit, pilot terms

8. Approve
Reply yes; the playbook is built and the FlexPrice plan is prepared

9. Show the summary
Credits used, approved pricing, FlexPrice dry run, next steps

Approved pricing becomes a FlexPrice plan in one command

1 POST /features

Metered feature

device_month, SUM of quantity

2 POST /plans

Plan

QubitSense Platform Plus Usage

3 POST /prices

Platform fee

$2,000 monthly, in advance

4 POST /prices

Usage price

Tiered: $400, then $320

5 POST /plans

Pilot plan

Paid Pilot (12 weeks)

6 POST /prices

Pilot fee

$40,000 one-time

Credits, per startup

500 → 405

after one playbook: 10 usage events, 95 credits, each charged exactly once

Created in the startup's own FlexPrice account, only after a mentor approves the pricing. Dry run by default.

What is built today, and what switches on with keys

Component	Status	Evidence
Code base: agents, tools, metering, API, CLI	**Done**	37 automated tests pass
Local Qwen pricing model	**Done**	Trained today; valid JSON on the QubitSense test
FlexPrice calls (customers, wallets, events, plans)	**Done**	Tested against a mock of the published API
Live BAND agents	**Needs keys**	Five agent IDs from app.band.ai
Live FlexPrice billing	**Needs keys**	A sandbox API key; first run in sandbox

Known limit: the model learned the format, not yet the judgment. It priced QubitSense per "device-month" at $400, while the startup sells per km (about $1,600/km).

Next 90 days: pilot with three startups, then the full cohort

Nov 2 – Nov 20

Set up and go live

- Create BAND agents and FlexPrice sandbox
- Deploy with Docker Compose
- First real playbook, mentor-scored

Nov 23 – Dec 14

Pilot with 3 startups

- Mentors approve or correct pricing
- Retrain Qwen on corrected answers
- Go / no-go gate on Dec 14

Jan 4 – Jan 29

Full cohort

- Every startup gets a playbook in week 1
- Credits granted as a cohort perk
- Track playbook quality and credits spent

The ask: BAND and FlexPrice sandbox keys, and three startups for the December pilot.

A GTM team in a box for every startup

BAND coordinates the agents. A private local model sets pricing. FlexPrice turns it into real billing, with every playbook paid for in credits.
